

Research Integrity @ Biological Science Journals

Transparency

Bernd Pulverer, EMBO

Singapore, 2010

Editors have to apply reasonable measures to ensure the published record is robust and to avoid misconduct

- Mandatory author contribution / conflict of interest declaration / ethics approval / consent / MTAs
- Contact all authors at submission and acceptance
- In house assessment of:
 - adequate citation: **primary literature**
 - adequate statistical description/standards
 - data repositories, adherence to community data standards
 - **plagiarism** and **image manipulation screening**
 - materials and methods: reagent transparency
- Full data display
- Allow refutations, corrigenda, 'expression of concern', clear retraction policy
- Report **(suspected)** misconduct, **also prepublication**, at institutional level
- Due care in referee selection (literature screen, database, honour reasonable exclusions); report **(proven)** reviewer misconduct; referee identity declaration
- Peer Review Process files
- Drop confidential referee comments
- Allow appeals

MANUSCRIPT FLOW

	2008
Total submissions	2918
Total rejected before review	76%
Executive Editor Prescreen	16%
Rejected by Editorial Team	48%
Rejected by Editorial Board	12%
Sent for external peer review	24%
Success rate in peer review	41%
Total acceptance rate	10%

This overall acceptance rate may appear very low, but reflects the fact that many submissions are not in agreement with the expectations and standards of the Journal. For more information, please also see the accompanying document (fate of rejected manuscripts), which shows that the vast majority of studies rejected at *The EMBO Journal* are eventually published in journals of lower impact and/or more specialized interest.

TIMINGS/EFFICIENCY

	2008
from submission to initial decision	4d
from submission to decision post review	31d
Average duration of revision	67d
Additional round of revision granted	42%
Average duration of extra revision	35d

Data Transparency

“From bench to website...”

Reproducibility: availability of published material, data and software

- Datasets obtained by experimentation, computation or data mining, should be made freely available, without restriction.
- Software should be described in sufficient detail to allow reproduction. Free access for non-commercial users is strongly recommended.
- Deposition of data in public databases, as far as available.

Statistics in cell biology – a crisis?

- calculate stats only when justified ($n > 2!$)
- n should be from *independent* experiments (specify)
- specify n for each measurement
- for $n < 5$ show all data points alongside error bar

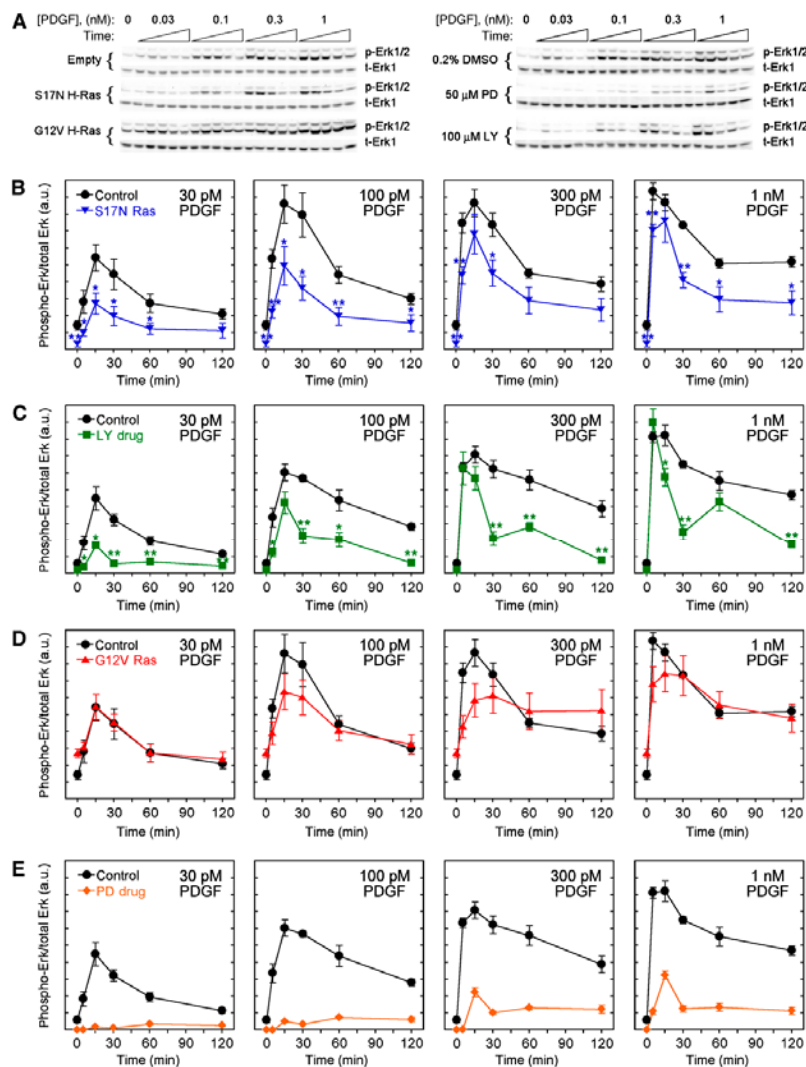

Figure 1

Systematic analysis of PDGF-stimulated Erk phosphorylation kinetics. **(A)** Immunoblots, representative of five or six independent experiments, used to quantify relative amounts of phosphorylated Erk (p-Erk1/2) and total Erk (t-Erk1). NIH 3T3 fibroblasts were modulated by retroviral induction of dominant-negative (S17N) or constitutively active (G12V) H-Ras expression or incubation with inhibitors of PI3K (100 μ M LY294002) or MEK (50 μ M PD098059). The respective controls are empty pBM-puro vector or 0.2% DMSO. Lysates were prepared from cells that were unstimulated or stimulated with PDGF-BB for 5, 15, 30, 60, or 120 min. **(B–E)** Quantification of Erk phosphorylation, normalized as described under Materials and methods, comparing either S17N Ras expression (B; $n=6$), PI3K inhibition (C; $n=5$), G12V Ras expression (D; $n=6$), or MEK inhibition (E; $n=5$) with their respective controls. Values are reported as mean \pm s.e.m., and comparisons to control in (B, C) are by Student's t -test: * $P<0.05$; ** $P<0.01$. Source data is available for this figure at www.nature.com/msb.

How to detect illicit image manipulation?

- Peer review
- Manual checks by editors
- Automated
- Post publication feedback
- Publication of raw data/metadata

JCB: 20% of accepted manuscripts
contain data that has to be revised

....despite editorial assessment
this has grown to 25%

....1% cannot be revised

Beautification and fraud

Publication rates are increasing in line with accelerating scientific progress that is boosted by buoyant funding and advances in facilitating technologies. Equally, the time-lag from bench to journal is decreasing and the pressures to publish mount with the increased chance of duplicated research and competitiveness. The old adage of 'publish or perish' is ever more pertinent and it is not surprising that sloppiness, plagiarism and even fraud rear their ugly heads. Ethics can fall by the wayside all too easily in today's intense research atmosphere.

None of these issues are new and it is hard to quantify whether the number of cases uncovered is rising faster than the increase in research output (*Nature* 435, 737–738 (2005)). Nevertheless, alarm bells have

director. Corresponding authors carry responsibility for evaluating the primary data and for confirming that the published data is real and properly processed. Editors and referees evaluate the importance and quality of data submitted for publication, but they cannot and should not be expected to view every submission as potentially fraudulent. Editors are not 'data police' and neither are referees. Additional data screening will be useful for filtering out 'beautified' data, but will not catch anyone but the most naive cheats. Well-crafted fraud is essentially impossible to detect without assessing the primary data or indeed being present throughout the experimentation.

It is important to remember that fraud is always doomed, in that

- Editors & referees are not 'data police'
- Well crafted fraud is essentially impossible to detect
- Corresponding authors ultimately carry responsibility for data

Routine Plagiarism check of pre-accepted manuscripts via Crosscheck

Does not detect 'mutated' text: concepts, results, selective citation

Dear Editor,

Could you tell me whether this decision was based
on the abstract/summary alone
or on the entire paper?

What else could be done?

- How much image checking is beneficial?
- Microattribution
- Double blind review
- Diversify referee pool
- Interjournal fraud alert: e.g. anonymized via COPE?
- Interjournal exchange on QRP referees?
